

**64 Kbit (8Kb x 8) ZEROPOWER<sup>®</sup> SRAM**

- INTEGRATED ULTRA LOW POWER SRAM, POWER-FAIL CONTROL CIRCUIT and BATTERY
- UNLIMITED WRITE CYCLES
- READ CYCLE TIME EQUALS WRITE CYCLE TIME
- AUTOMATIC POWER-FAIL CHIP DESELECT and WRITE PROTECTION
- WRITE PROTECT VOLTAGES (V<sub>PF</sub>D = Power-fail Deselect Voltage):
  - M48Z08: 4.50V ≤ V<sub>PF</sub>D ≤ 4.75V
  - M48Z18: 4.20V ≤ V<sub>PF</sub>D ≤ 4.50V
- SELF-CONTAINED BATTERY in the CAPHAT DIP PACKAGE
- PACKAGING INCLUDES a 28 LEAD SOIC and SNAPHAT<sup>®</sup> TOP (to be Ordered Separately)
- SOIC PACKAGE PROVIDES DIRECT CONNECTION for a SNAPHAT TOP which CONTAINS the BATTERY
- PIN and FUNCTION COMPATIBLE with the DS1225 and JEDEC STANDARD 8K x 8 SRAMs

**Figure 1. Logic Diagram**

**DESCRIPTION**

The M48Z08/18 ZEROPOWER<sup>®</sup> RAM is an 8K x 8 non-volatile static RAM which is pin and functional compatible with the DS1225. The monolithic chip is available in two special packages to provide a highly integrated battery backed-up memory solution.

Table 2. Absolute Maximum Ratings <sup>(1)</sup>

Symbol	Parameter	Value	Unit
$T_A$	Ambient Operating Temperature	-40 to 85	°C
$T_{STG}$	Storage Temperature ( $V_{CC}$ Off)	-40 to 85	°C
$T_{SLD}^{(2)}$	Lead Solder Temperature for 10 seconds	260	°C
$V_{IO}$	Input or Output Voltages	-0.3 to 7	V
$V_{CC}$	Supply Voltage	-0.3 to 7	V
$I_O$	Output Current	20	mA
$P_D$	Power Dissipation	1	W

Notes: 1. Stresses greater than those listed under "Absolute Maximum Ratings" may cause permanent damage to the device. This is a stress rating only and functional operation of the device at these or any other conditions above those indicated in the operational section of this specification is not implied. Exposure to the absolute maximum rating conditions for extended periods of time may affect reliability.

2. Soldering temperature not to exceed 260°C for 10 seconds (total thermal budget not to exceed 150°C for longer than 30 seconds).

**CAUTION:** Negative undershoots below -0.3 volts are not allowed on any pin while in the Battery Back-up mode.

**CAUTION:** Do NOT wave solder SOIC to avoid damaging SNAPHAT sockets.

Table 3. Operating Modes <sup>(1)</sup>

Mode	$V_{CC}$	$\bar{E}$	$\bar{G}$	$\bar{W}$	DQ0-DQ7	Power
Deselect	4.75V to 5.5V or 4.5V to 5.5V	$V_{IH}$	X	X	High Z	Standby
Write		$V_{IL}$	X	$V_{IL}$	$D_{IN}$	Active
Read		$V_{IL}$	$V_{IL}$	$V_{IH}$	$D_{OUT}$	Active

Deselect	$\leq V_{SO}$	X	X	X	High Z	Battery Back-up Mode

Note: 1. X =  $V_{IH}$  or  $V_{IL}$ ;  $V_{SO}$  = Battery Back-up Switchover Voltage.

Figure 3. Block Diagram

**DESCRIPTION** (cont'd)

The M48Z08/18 is a non-volatile pin and function equivalent to any JEDEC standard 8K x 8 SRAM. It also easily fits into many ROM, EPROM, and EEPROM sockets, providing the non-volatility of PROMs without any requirement for special write timing or limitations on the number of writes that can be performed.

The 28 pin 600mil DIP CAPHAT™ houses the M48Z08/18 silicon with a long life lithium button cell in a single package.

The 28 pin 330mil SOIC provides sockets with gold plated contacts at both ends for direct connection to a separate SNAPHAT housing containing the battery. The unique design allows the SNAPHAT battery package to be mounted on top of the SOIC package after the completion of the surface mount process. Insertion of the SNAPHAT housing after reflow prevents potential battery damage due to the high temperatures required for device surface-mounting. The SNAPHAT housing is keyed to prevent reverse insertion.

The SOIC and battery packages are shipped separately in plastic anti-static tubes or in Tape & Reel form.

$t_{DR}$	Expected Data Retention Time	11			YEARS

**Note:** 1. All voltages referenced to  $V_{SS}$ .

### DESCRIPTION (cont'd)

For the 28 lead SOIC, the battery package (i.e. SNAPHAT) part number is "M4Z28-BR00SH1".

The M48Z08/18 also has its own Power-fail Detect circuit. The control circuitry constantly monitors the single 5V supply for an out of tolerance condition.

When  $V_{CC}$  is out of tolerance, the circuit write protects the SRAM, providing a high degree of data security in the midst of unpredictable system operation brought on by low  $V_{CC}$ . As  $V_{CC}$  falls below approximately 3V, the control circuitry connects the battery which maintains data until valid power returns.

**Table 8. Power Down/Up Mode AC Characteristics**  
( $T_A = 0$  to  $70^\circ\text{C}$ )

Symbol	Parameter	Min	Max	Unit
$t_{PD}$	$\overline{E}$ or $\overline{W}$ at $V_{IH}$ before Power Down	0		$\mu\text{s}$
$t_F^{(1)}$	$V_{PFD}(\text{max})$ to $V_{PFD}(\text{min})$ $V_{CC}$ Fall Time	300		$\mu\text{s}$
$t_{FB}^{(2)}$	$V_{PFD}(\text{min})$ to $V_{SO}$ $V_{CC}$ Fall Time	10		$\mu\text{s}$
$t_R$	$V_{PFD}(\text{min})$ to $V_{PFD}(\text{max})$ $V_{CC}$ Rise Time	0		$\mu\text{s}$
$t_{RB}$	$V_{SO}$ to $V_{PFD}(\text{min})$ $V_{CC}$ Rise Time	1		$\mu\text{s}$
$t_{REC}$	$\overline{E}$ or $\overline{W}$ at $V_{IH}$ after Power Up	1		ms

**Notes:** 1.  $V_{PFD}(\text{max})$  to  $V_{PFD}(\text{min})$  fall time of less than  $t_F$  may result in deselection/write protection not occurring until  $200 \mu\text{s}$  after  $V_{CC}$  passes  $V_{PFD}(\text{min})$ .  
2.  $V_{PFD}(\text{min})$  to  $V_{SO}$  fall time of less than  $t_{FB}$  may cause corruption of RAM data.

**Figure 5. Power Down/Up Mode AC Waveforms**

**Note:** Inputs may or may not be recognized at this time. Caution should be taken to keep  $\overline{E}$  high as  $V_{CC}$  rises past  $V_{PFD}(\text{min})$ . Some systems may perform inadvertent write cycles after  $V_{CC}$  rises above  $V_{PFD}(\text{min})$  but before normal system operations begin. Even though a power on reset is being applied to the processor, a reset condition may not occur until after the system clock is running.

## M48Z08, M48Z18

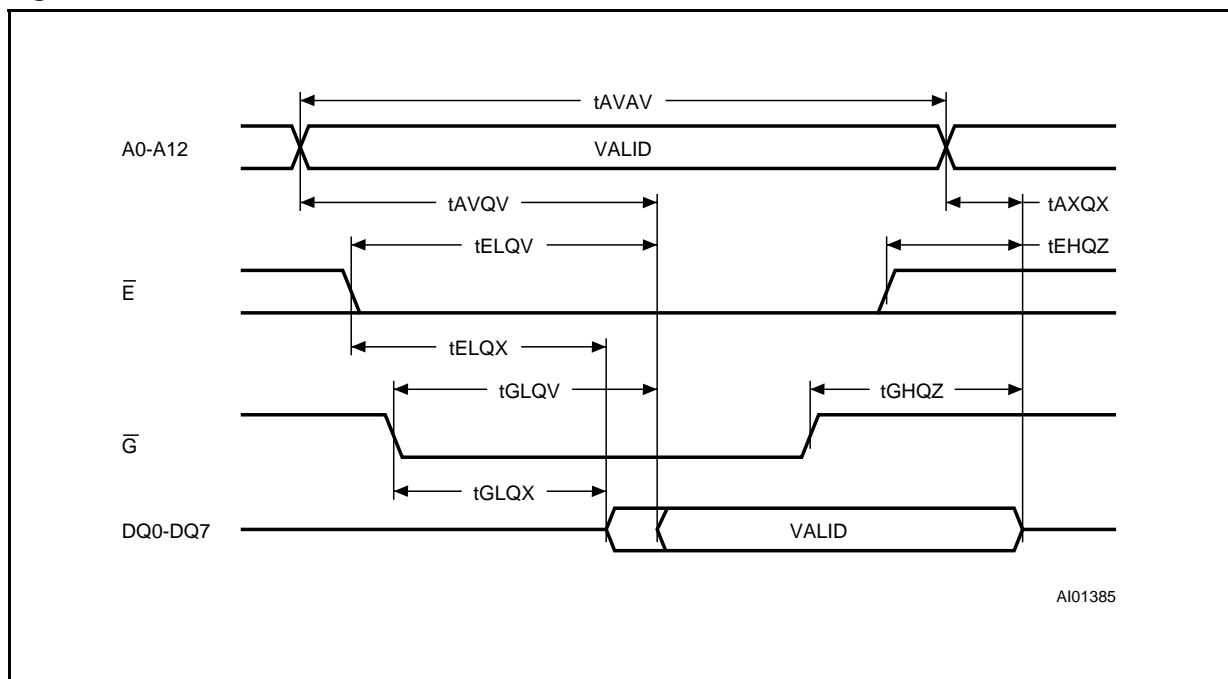

**Table 9. Read Mode AC Characteristics**

( $T_A = 0$  to  $70^\circ\text{C}$ ;  $V_{CC} = 4.75\text{V}$  to  $5.5\text{V}$  or  $4.5\text{V}$  to  $5.5\text{V}$ )

$t_{EHAX}$	Chip Enable High to Address Transition	10		ns
$t_{DVWH}$	Input Valid to Write Enable High	50		ns
$t_{DVEH}$	Input Valid to Chip Enable High	30		ns
$t_{WHDX}$	Write Enable High to Input Transition	5		ns
$t_{EHDX}$	Chip Enable High to Input Transition	5		ns
$t_{WLQZ}^{(1, 2)}$	Write Enable Low to Output Hi-Z		50	ns
$t_{AVWH}$	Address Valid to Write Enable High	80		ns
$t_{AVEH}$	Address Valid to Chip Enable High	80		ns
$t_{WHQX}^{(1, 2)}$	Write Enable High to Output Transition	10		ns

Notes: 1.  $C_L = 30\text{pF}$  (see Figure 4).

2. If  $\overline{E}$  goes low simultaneously with  $\overline{W}$  going low, the outputs remain in the high impedance state.

## READ MODE

The M48Z08/18 is in the Read Mode whenever  $\overline{W}$  (Write Enable) is high and  $\overline{E}$  (Chip Enable) is low. The device architecture allows ripple-through access of data from eight of 65,536 locations in the static storage array. Thus, the unique address specified by the 13 Address Inputs defines which one of the 8,192 bytes of data is to be accessed. Valid data will be available at the Data I/O pins within Address Access time ( $t_{AVQV}$ ) after the last address input signal is stable, providing that the  $\overline{E}$  and  $\overline{G}$  access times are also satisfied. If the  $\overline{E}$  and  $\overline{G}$  access times are not met, valid data will be available after the latter of the Chip Enable Access time ( $t_{ELQV}$ ) or Output Enable Access time ( $t_{GLQV}$ ).

The state of the eight three-state Data I/O signals is controlled by  $\overline{E}$  and  $\overline{G}$ . If the outputs are activated before  $t_{AVQV}$ , the data lines will be driven to an indeterminate state until  $t_{AVQV}$ . If the Address Inputs are changed while  $\overline{E}$  and  $\overline{G}$  remain active,

output data will remain valid for Output Data Hold time ( $t_{AXQX}$ ) but will go indeterminate until the next Address Access.

## WRITE MODE

The M48Z08/18 is in the Write Mode whenever  $\overline{W}$  and  $\overline{E}$  are active. The start of a write is referenced from the latter occurring falling edge of  $\overline{W}$  or  $\overline{E}$ .

A write is terminated by the earlier rising edge of  $\overline{W}$  or  $\overline{E}$ . The addresses must be held valid throughout the cycle.  $\overline{E}$  or  $\overline{W}$  must return high for a minimum of  $t_{EHAX}$  from Chip Enable or  $t_{WHAX}$  from Write Enable prior to the initiation of another read or write cycle. Data-in must be valid  $t_{DVWH}$  prior to the end of write and remain valid for  $t_{WHDX}$  afterward.  $\overline{G}$  should be kept high during write cycles to avoid bus contention; although, if the output bus has been activated by a low on  $\overline{E}$  and  $\overline{G}$ , a low on  $\overline{W}$  will disable the outputs  $t_{WLQZ}$  after  $\overline{W}$  falls.

Figure 7. Write Enable Controlled, Write AC Waveforms

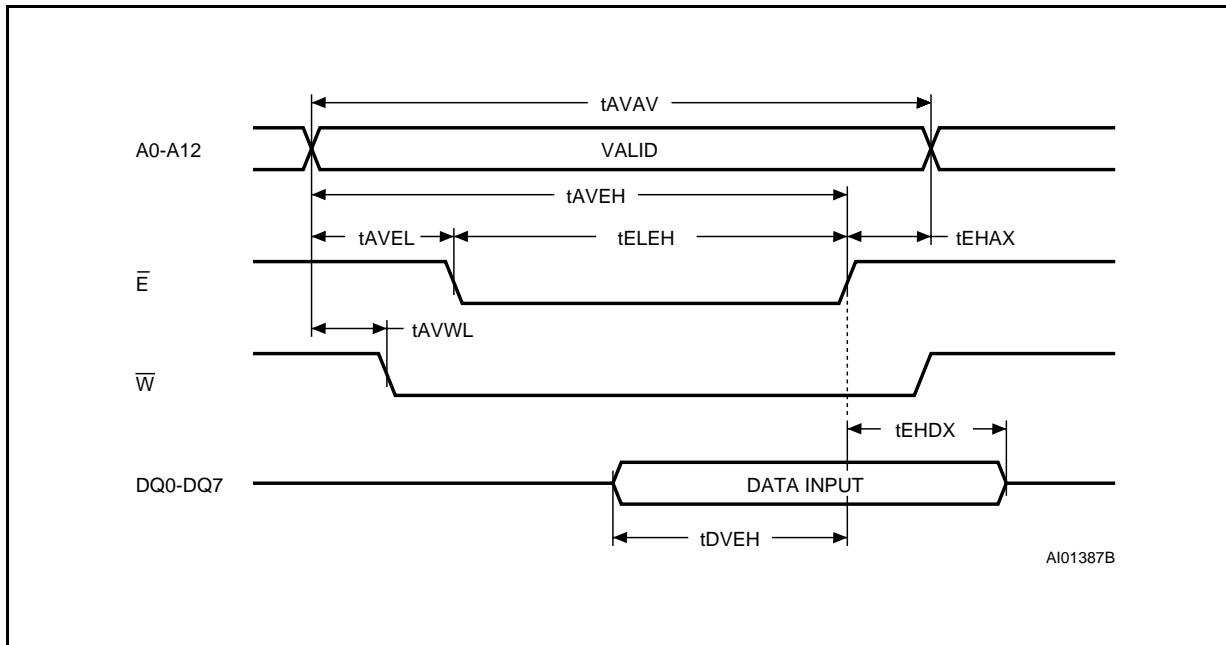

Figure 8. Chip Enable Controlled, Write AC Waveforms

### DATA RETENTION MODE

With valid  $V_{CC}$  applied, the M48Z08/18 operates as a conventional BYTEWIDE™ static RAM. Should the supply voltage decay, the RAM will automatically power-fail deselect, write protecting itself when  $V_{CC}$  falls within the  $V_{PFD(max)}$ ,  $V_{PFD(min)}$  window. All outputs become high impedance, and all inputs are treated as "don't care."

**Note:** A power failure during a write cycle may corrupt data at the currently addressed location, but does not jeopardize the rest of the RAM's content. At voltages below  $V_{PFD(min)}$ , the user can be assured the memory will be in a write protected state, provided the  $V_{CC}$  fall time is not less than  $t_F$ . The M48Z08/18 may respond to transient noise spikes on  $V_{CC}$  that reach into the deselect window during the time the device is sampling  $V_{CC}$ . Therefore, decoupling of the power supply lines is recommended.

When  $V_{CC}$  drops below  $V_{SO}$ , the control circuit switches power to the internal battery which preserves data and powers the clock. The internal button cell will maintain data in the M48Z08/18 for an accumulated period of at least 11 years when  $V_{CC}$  is less than  $V_{SO}$ . As system power returns and  $V_{CC}$  rises above  $V_{SO}$ , the battery is disconnected,

and the power supply is switched to external  $V_{CC}$ . Write protection continues until  $V_{CC}$  reaches  $V_{PFD(min)}$  plus  $t_{REC(min)}$ .  $\bar{E}$  should be kept high as  $V_{CC}$  rises past  $V_{PFD(min)}$  to prevent inadvertent write cycles prior to system stabilization. Normal RAM operation can resume  $t_{REC}$  after  $V_{CC}$  exceeds  $V_{PFD(max)}$ .

For more information on Battery Storage Life refer to the Application Note AN1012.

### SYSTEM BATTERY LIFE

The useful life of the battery in the M48Z08/18 is expected to ultimately come to an end for one of two reasons: either because it has been discharged while providing current to the RAM in the battery back-up mode, or because the effects of aging render the cell useless before it can actually be completely discharged. The two effects are virtually unrelated, allowing discharge or Capacity Consumption, and the effects of aging or Storage Life, to be treated as two independent but simultaneous mechanisms. The earlier occurring failure mechanism defines the battery system life of the M48Z08/18.

Figure 9. Predicted Battery Storage Life versus Temperature

**Cell Storage Life**

Storage life is primarily a function of temperature. Figure 9 illustrates the approximate storage life of the M48Z08/18 battery over temperature. The results in Figure 9 are derived from temperature accelerated life test studies performed at SGS-THOMSON. For the purpose of the testing, a cell failure is defined as the inability of a cell stabilized at 25°C to produce a 2.4V closed circuit voltage across a 250 kΩ load resistor. The two lines, t<sub>1%</sub> and t<sub>50%</sub>, represent different failure rate distributions for the cell's storage life. At 70°C, for example, the t<sub>1%</sub> line indicates that an M48Z08/18 has a 1% chance of having a battery failure 28 years into its life while the t<sub>50%</sub> shows the part has a 50% chance of failure at the 50 year mark. The t<sub>1%</sub> line represents the practical onset of wear out and can be considered the worst case Storage Life for the cell. The t<sub>50%</sub> can be considered the normal or average life.

**Calculating Storage Life**

The following formula can be used to predict storage life:

$$\frac{1}{\{(TA1/TT)/SL1\} + \{(TA2/TT)/SL2\} + \dots + \{(TAN/TT)/SLN\}}$$

where,

- TA1, TA2, TAN = time at ambient temperature 1, 2, etc.
- TT = total time = TA1+TA2+...+TAN
- SL1, SL2, SLN = storage life at temperature 1, 2, etc.

For example, an M48Z08/18 is exposed to temperatures of 55°C or less for 8322 hrs/yr, and temperatures greater than 60°C but less than 70°C for the remaining 438 hrs/yr. Reading predicted t<sub>1%</sub> values from Figure 9,

- SL1 ≅ 200 yrs, SL2 = 28 yrs
- TT = 8760 hrs/yr
- TA1 = 8322 hrs/yr, TA2 = 438 hrs/yr

Predicted storage life ≥

$$\frac{1}{\{(8322/8760)/200\} + \{(431/8760)/28\}}$$

or 154 years.

As can be seen from these calculations and the results, the expected lifetime of the M48Z08/18 should exceed most system requirements.

**Estimated System Life**

Since either storage life or capacity consumption can end the battery's life, the system life is marked by which ever occurs first.

**Reference for System Life**

Each M48Z08/18 is marked with a nine digit manufacturing date code in the form of H99XXYYZZ. For example, H995B9431 is:

- H = fabricated in Carrollton, TX
- 9 = assembled in Muar, Malaysia,
- 9 = tested in Muar, Malaysia,
- 5B = lot designator,
- 9431 = assembled in the year 1994, work week 31.

**POWER SUPPLY DECOUPLING and UNDER-SHOOT PROTECTION**

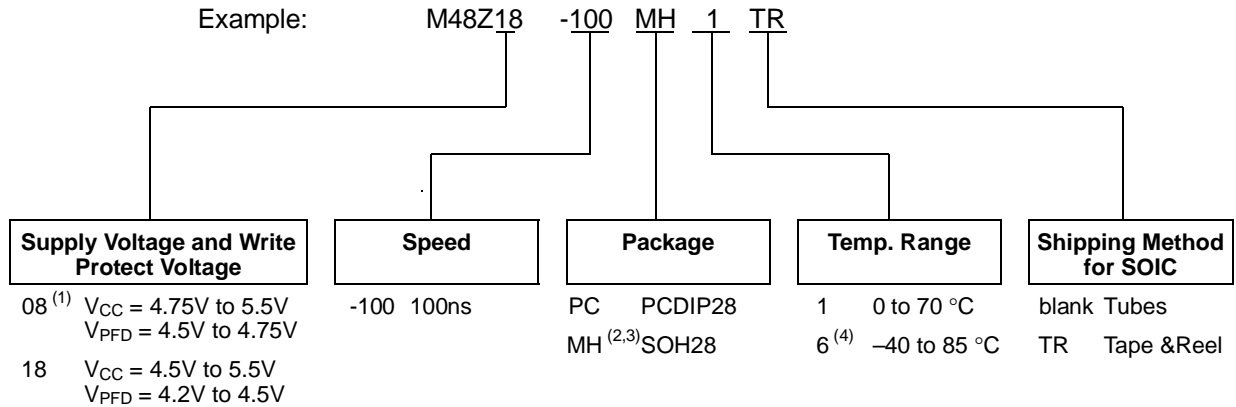

I<sub>CC</sub> transients, including those produced by output switching, can produce voltage fluctuations, resulting in spikes on the V<sub>CC</sub> bus. These transients can be reduced if capacitors are used to store energy, which stabilizes the V<sub>CC</sub> bus. The energy stored in the bypass capacitors will be released as low going spikes are generated or energy will be absorbed when overshoots occur. A ceramic bypass capacitor value of 0.1μF (as shown in Figure 10) is recommended in order to provide the needed filtering.

In addition to transients that are caused by normal SRAM operation, power cycling can generate negative voltage spikes on V<sub>CC</sub> that drive it to values below V<sub>SS</sub> by as much as one Volt. These negative spikes can cause data corruption in the SRAM while in battery backup mode. To protect from these voltage spikes, it is recommended to connect a schottky diode from V<sub>CC</sub> to V<sub>SS</sub> (cathode connected to V<sub>CC</sub>, anode to V<sub>SS</sub>). Schottky diode 1N5817 is recommended for through hole and MBRS120T3 is recommended for surface mount.

**Figure 10. Supply Voltage Protection**

**ORDERING INFORMATION SCHEME**

- Notes:**
1. The M48Z08 part is offered with the PCDIP28 (i.e. CAPHAT) package only.
  2. The SOIC package (SOH28) requires the battery package (SNAPHAT) which is ordered separately under the part number "M4Z28-BR00SH1" in plastic tube or "M4Z28-BR00SH1TR" in Tape & Reel form.
  3. Delivery may include either the 2-pin version of the SOIC/SNAPHAT or the 4-pin version of the SOIC/SNAPHAT. Both are functionally equivalent (see package drawing section for details).
  4. Temperature range available for M48Z18 product only.

**Caution:** Do not place the SNAPHAT battery package "M4Z28-BR00SH1" in conductive foam since this will drain the lithium button-cell battery.

For a list of available options (Speed, Package, etc...) or for further information on any aspect of this device, please contact the STMicroelectronics Sales Office nearest to you.
