

DTMF/Modem/musical-tone generators**PCD3311C; PCD3312C****GENERAL DESCRIPTION**

The PCD3311C and PCD3312C are single-chip silicon gate CMOS integrated circuits. They are intended to provide dual-tone multi-frequency (DTMF) combinations required for tone dialling systems in telephone sets which contain a microcontroller for the control functions.

The various audio output frequencies are generated from an on-chip 3,58 MHz quartz crystal-controlled oscillator.

The devices can interface directly to all standard microcontrollers by accepting a binary-coded parallel input or serial data input (I^2C -bus).

With their on-chip voltage reference the PCD3311C and PCD3312C provide constant output amplitudes which are independent of the operating supply voltage and ambient temperature.

An on-chip filtering system assures a very low total harmonic distortion in accordance with the CEPT T/CS46-03 (= former CS203) recommendations.

In addition to the standard DTMF frequencies the devices provide 12 MODEM frequencies (300 to 1200 bits per second) used in simplex MODEM applications and two octaves of musical scale in steps of semitones.

Features

- Stabilized output voltage level
- Low output distortion with on-chip filtering (CEPT CS 203 compatible)
- Latched inputs for data bus applications
- I^2C -bus compatible
- Mode select input (selection of parallel or serial data input)
- MODEM and melody tone generators

QUICK REFERENCE DATA

| parameter | symbol | min. | typ. | max. | unit |
|---|---------------|------|------|------|-------------|
| Operating supply voltage | V_{DD} | 2,5 | — | 6,0 | V |
| Operating supply current | I_{DD} | — | — | 0,9 | mA |
| Static standby current | I_{DD0} | — | — | 3 | μA |
| DTMF output voltage level (RMS values) | | | | | |
| HIGH group | $V_{HG(rms)}$ | 158 | 192 | 205 | mV |
| LOW group | $V_{LG(rms)}$ | 125 | 150 | 160 | mV |
| Pre-emphasis of group | ΔV_G | 1,85 | 2,10 | 2,35 | dB |
| Total harmonic distortion | THD | — | —25 | — | dB |
| Operating ambient temperature range | T_{amb} | —25 | — | +70 | $^{\circ}C$ |

PACKAGE OUTLINES

PCD3311CP: 14-lead DIL; plastic (SOT27).

PCD3311CT: 16-lead mini-pack; plastic (SO16L; SOT162A).

PCD3312CP: 8-lead DIL; plastic (SOT97).

PCD3312CT: 8-lead mini-pack; plastic (SO8L; SOT176C).

FUNCTIONAL DESCRIPTION

Clock/oscillator (OSCI and OSCO)

The timebase for the PCD3311C and PCD3312C is a crystal-controlled oscillator with a 3,58 MHz quartz crystal connected between OSCI and OSCO. Alternatively, the OSCI input can be driven from an external clock.

Mode select (MODE)

This input selects the data input mode. When connected to V_{DD}, data can be received in the parallel mode (only for the PCD3311C), or, when connected to V_{SS} or left open, data can be received via the serial I²C-bus (for both PCD3311 and PCD3312).

Parallel mode can only be obtained for the PCD3311 by setting MODE input HIGH.

DTMF/Modem/musical-tone generators

PCD3311C; PCD3312C

FUNCTIONAL DESCRIPTION (continued)

Data inputs (D_0 , D_1 , D_2 , D_3 , D_4 and D_5)

Inputs D_0 and D_1 have no internal pull-down or pull-up resistors and must not be left open in any application. Inputs D_2 to D_5 have internal pull-down. D_5 and D_4 are used to select between DTMF dual, DTMF single, MODEM and melody tones (see Table 1). D_3 to D_0 select the combination of the tones for DTMF or single-tone itself.

Table 1 D_5 and D_4 in accordance with the selected application

| D_5 | D_4 | application |
|-------|-------|--|
| 0 | 0 | DTMF single tones; standby; melody tones |
| 0 | 1 | DTMF dual tones (all 16 combinations) |
| 1 | 0 | MODEM tones; standby; melody tones |
| 1 | 1 | melody tones |

1 = H = HIGH voltage level

0 = L = LOW voltage level

Note: Tables 2, 3, 4 and 5 show all input codes and their corresponding output frequencies.

Strobe input (STROBE, only for the PCD3311C)

This input (with internal pull-down) allows the loading of parallel data into D_0 to D_5 when MODE is HIGH.

The data inputs must be stable preceding the positive-going edge of the strobe pulse (active HIGH). Input data are loaded at the negative-going edge of the strobe pulse and then the corresponding tone (or standby mode) is provided at the TONE output. The output remains unchanged until the negative-going edge of the next STROBE pulse (for new data) is received.

Serial mode can only be obtained for the PCD3311C by setting MODE input LOW.

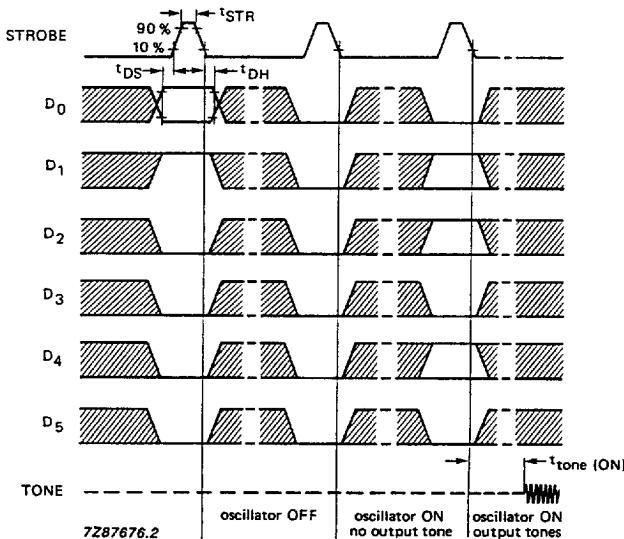

Fig. 5 Timing diagram showing control possibilities of the oscillator and the TONE output (e.g. 770 Hz + 1477 Hz) in the parallel mode (MODE = HIGH).

DTMF/Modem/musical-tone generators

PCD3311C; PCD3312C

Serial clock and data inputs (SCL and SDA)

SCL and SDA are combined with D₀ and D₁ respectively. For the PCD3311C the selection of SCL and SDA is controlled by the MODE input. SCL and SDA are serial clock and data lines according to the I²C-bus specification (see "CHARACTERISTICS OF THE I²C-BUS"). Both inputs must be pulled-up externally to V_{DD}.

Address input (A₀)

A₀ is the slave address input and it identifies the device when up to two PCD3311C or PCD3312C devices are connected to the same I²C bus. In any case A₀ must be connected to V_{DD} or V_{SS}.

I²C bus data configuration (see Fig. 6)

The PCD3311C and PCD3312C are always slave receivers in the I²C-bus configuration (R/W bit = 0).

The slave address consists of 7 bits in the serial mode for the PCD3311C as well as for the PCD3312C, where the least significant bit is selectable by hardware on input A₀ and the other more significant bits are internally fixed. In the serial mode the same input codes are used as in the parallel mode (see Tables 2, 3, 4, and 5). D₆ and D₇ are don't care (X) bits.

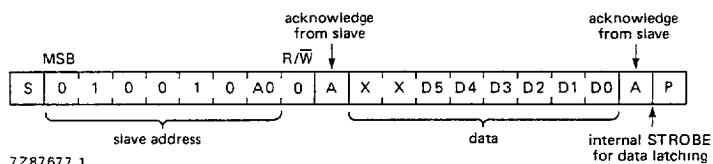

Fig. 6 I²C-bus data format.

Tone output (TONE)

The single and the dual tones which are provided at the TONE output are filtered by an on-chip switched-capacitor filter, followed by an active RC low-pass filter. Therefore, the total harmonic distortion of the DTMF tones fulfils the CEPT CS46-03 recommendations. An on-chip reference voltage provides output-tone levels independent of the supply voltage. Table 3 shows the frequency tolerance of the output tones for DTMF signalling; Tables 4 and 5 for the modem and melody tones.

Power-on reset

In order to avoid undefined states of the devices when the power is switched ON, an internal reset circuit sets them to the standby mode (oscillator OFF).

Table 2 Input data for control (no output tone; TONE in 3-state)

| D ₅ | D ₄ | D ₃ | D ₂ | D ₁ | D ₀ | HEX | oscillator |
|----------------|----------------|----------------|----------------|----------------|----------------|-------|------------|

DTMF/Modem/musical-tone generators

PCD3311C; PCD3312C

CHARACTERISTICS OF THE I²C-BUS

The I²C-bus is for 2-way, 2-line communication between different ICs or modules. The two lines are a serial data line (SDA) and a serial clock line (SCL). Both lines must be connected to a positive supply via a pull-up resistor when connected to the output stages of a device. Data transfer may be initiated only when the bus is not busy.

Bit transfer

One data bit is transferred during each clock pulse. The data on the SDA line must remain stable during the HIGH period of the clock pulse as changes in the data line at this time will be interpreted as control signals.

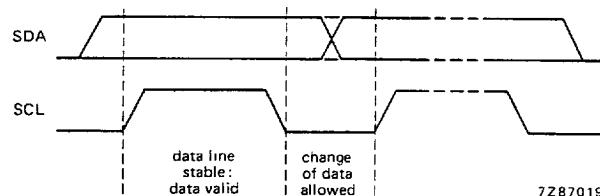

Fig. 7 Bit transfer.

Start and stop conditions

Both data and clock lines remain HIGH when the bus is not busy. A HIGH-to-LOW transition of the data line, while the clock is HIGH is defined as the start condition (S). A LOW-to-HIGH transition of the data line while the clock is HIGH is defined as the stop condition (P).

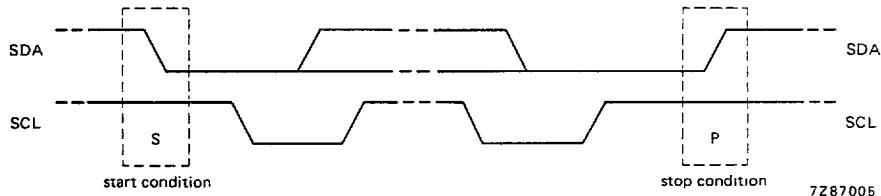

Fig. 8 Definition of start and stop conditions.

System configuration

A device generating a message is a "transmitter", a device receiving a message is the "receiver". The device that controls the message is the "master" and the devices which are controlled by the master are the "slaves".

DTMF/Modem/musical-tone generators

PCD3311C; PCD3312C

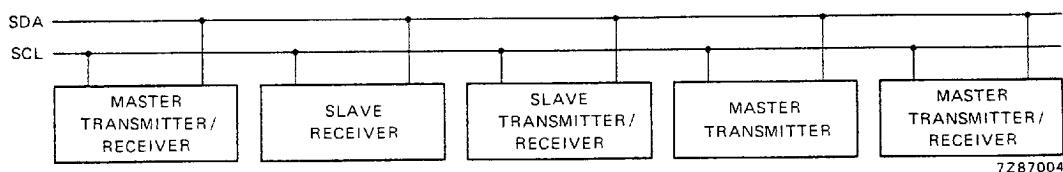

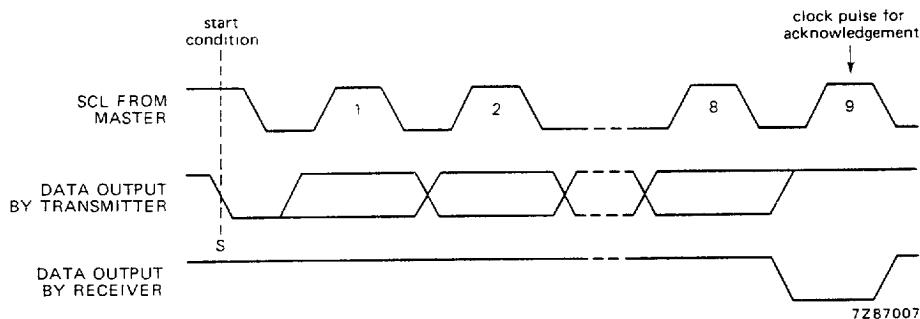

Fig. 9 System configuration.

Acknowledge

The number of data bytes transferred between the start and stop conditions from transmitter to receiver is not limited. Each byte of eight bits is followed by one acknowledge bit. The acknowledge bit is a HIGH level put on the bus by the transmitter whereas the master generates an extra acknowledgement related clock pulse. A slave receiver which is addressed must generate an acknowledgement after the reception of each byte. Also a master must generate an acknowledgement after the reception of each byte that has been clocked out of the slave transmitter. The device that acknowledges has to pull down the SDA line during the acknowledgement clock pulse, so that the SDA line is stable LOW during the HIGH period of the acknowledgement clock pulse, set-up and hold times must be taken into account. A master receiver must signal an end of data to the transmitter by *not* generating an acknowledgement on the last byte that has been clocked out of the slave. In this event the transmitter must leave the data line HIGH to enable the master to generate a stop condition.

Fig. 10 Acknowledgement on the I²C-bus.

PCD3311C; PCD3312C

CHARACTERISTICS OF THE I²C-BUS (continued)

Timing specifications

Within the I²C-bus specifications a high-speed mode and a low-speed mode are defined. The ICs operate in both modes and the timing requirements are as follows:

High-speed mode

Masters generate a bus clock with a maximum frequency of 100 kHz. Detailed timing is shown in Fig. 11.

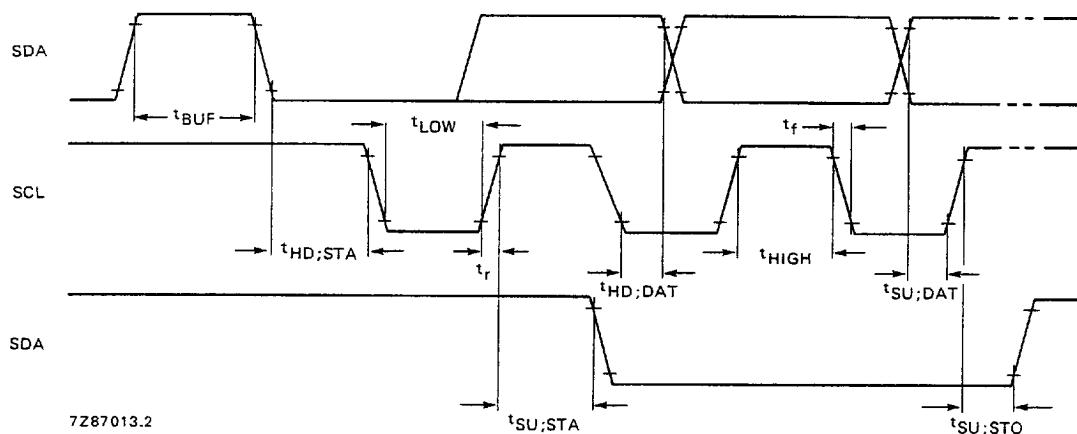

Fig. 11 Timing of the high-speed mode.

Where:

| | | |
|---------------|----------------------|---|
| t_{BUF} | $t \geq t_{LOWmin}$ | The minimum time the bus must be free before a new transmission can start |
| $t_{HD; STA}$ | $t \geq t_{HIGHmin}$ | Start condition hold time |
| t_{LOWmin} | 4,7 μ s | Clock LOW period |
| $t_{HIGHmin}$ | 4 μ s | Clock HIGH period |
| $t_{SU; STA}$ | $t \geq t_{LOWmin}$ | Start condition set-up time, only valid for repeated start code |
| $t_{HD; DAT}$ | $t \geq 0 \mu$ s | Data hold time |
| $t_{SU; DAT}$ | $t \geq 250$ ns | Data set-up time |
| t_r | $t \leq 1 \mu$ s | Rise time of both the SDA and SCL line |
| t_f | $t \leq 300$ ns | Fall time of both the SDA and SCL line |
| $t_{SU; STO}$ | $t \geq t_{LOWmin}$ | Stop condition set-up time |

Note

All the timing values refer to V_{IH} and V_{IL} levels with a voltage swing of V_{SS} to V_{DD} .

DTMF/Modem/musical-tone generators

PCD3311C; PCD3312C

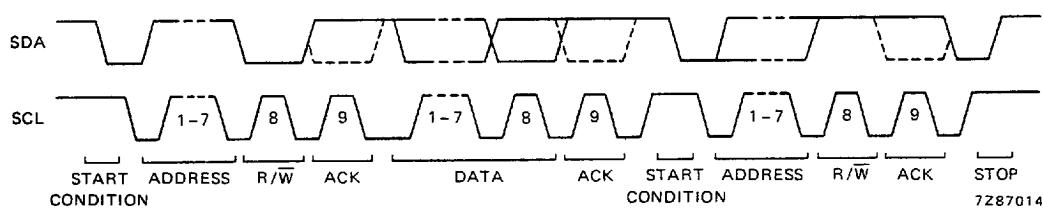

Fig. 12 Complete data transfer in the high-speed mode.

Where:

Clock t_{LOWmin} $4,7 \mu s$ $t_{HIGHmin}$ $4 \mu s$

The dashed line is the acknowledgement of the receiver

Mark-to-space ratio $1 : 1$ (LOW-to-HIGH)

Max. number of bytes unrestricted

Premature termination of transfer allowed by generation of STOP condition

Acknowledge clock bit must be provided by the master

Low-speed mode

Masters generate a bus clock with a maximum frequency of 2 kHz; a minimum LOW period of $105 \mu s$ and a minimum HIGH period of $365 \mu s$. The mark-to-space ratio is $1 : 3$ LOW-to-HIGH. Detailed timing is shown in Fig. 13.

| Acknowledge clock bit | must be provided by master |

* Only valid for repeated start code.

DTMF/Modem/musical-tone generators

PCD3311C; PCD3312C

RATINGS

Limiting values in accordance with the Absolute Maximum System (IEC 134)

| parameter | symbol | min. | max. | unit |
|-------------------------------------|--------------------------|------|----------------|------|
| Supply voltage range | V_{DD} | -0,8 | + 8,0 | V |
| Input voltage range (any input) | V_I | -0,8 | $V_{DD} + 0,8$ | V |
| DC input current (any input) | $\pm I_I$ | - | 10 | mA |
| DC output current (any output) | $\pm I_O$ | - | 10 | mA |
| Supply current | $\pm I_{DD}; \pm I_{SS}$ | - | 50 | mA |
| Power dissipation per output | P_O | - | 50 | mW |
| Total power dissipation per package | P_{tot} | - | 300 | mW |
| Operating ambient temperature range | T_{amb} | -25 | + 70 | °C |
| Storage temperature range | T_{stg} | -65 | + 150 | °C |

CHARACTERISTICS

$V_{DD} = 2,5$ to 6 V; $V_{SS} = 0$ V; crystal parameters: $f_{osc} = 3,579\ 545$ MHz, $R_{Smax} = 50\ \Omega$;
 $T_{amb} = -25$ to + 70 °C; unless otherwise specified

| parameter | symbol | min. | typ. | max. | unit |
|--|-----------|---------------------|------|---------------------|------|
| Operating supply voltage | V_{DD} | 2,5 | - | 6,0 | V |
| Operating supply current (note 1) oscillator ON; $V_{DD} = 3$ V | | | | | |
| no output tone | I_{DD} | - | 50 | 100 | µA |
| single output tone | I_{DD} | - | 0,5 | 0,8 | mA |
| dual output tone | I_{DD} | - | 0,6 | 0,9 | mA |
| Static standby current oscillator OFF; note 1 | I_{DDO} | - | - | 3 | µA |
| Inputs/outputs (SDA) | | | | | |
| D_0 to D_5 ; MODE; STROBE | | | | | |
| Input voltage LOW | V_{IL} | 0 | - | $0,3 \times V_{DD}$ | V |
| Input voltage HIGH | V_{IH} | $0,7 \times V_{DD}$ | - | V_{DD} | V |
| D_2 to D_5 ; MODE; STROBE; A_0 | | | | | |
| Pull-down input current $V_I = V_{DD}$ | $-I_{IL}$ | 30 | 150 | 300 | nA |
| SCL (D_0); SDA (D_1) | | | | | |
| Output current LOW (SDA) $V_{OL} = 0,4$ V | I_{OL} | 3 | - | - | mA |
| Clock frequency (see Fig. 11) | f_{SCL} | - | - | 100 | kHz |
| Input capacitance; $V_I = V_{SS}$ | C_I | - | - | 7 | pF |
| Allowable input spike pulse width | t_I | - | - | 100 | ns |

DTMF/Modem/musical-tone generators

PCD3311C; PCD3312C

CHARACTERISTICS (continued)

| parameter | symbol | min. | typ. | max. | unit |
|---|-----------------------|------|-------------------|----------------------------------|------|
| TONE output (see Fig. 15) | | | | | |
| DTMF output voltage levels (r.m.s. values) | | | | | |
| HIGH group | V _{HG(rms)} | 158 | 192 | 205 | mV |
| LOW group | V _{LG(rms)} | 125 | 150 | 160 | mV |
| DC voltage level | V _{DC} | — | ½ V _{DD} | — | V |
| Pre-emphasis of group | ΔV _G | 1,85 | 2,10 | 2,35 | dB |
| Total harmonic distortion T _{amb} = 25 °C | | | | | |
| dual tone; note 2 | THD | — | -25 | — | dB |
| modem tone, note 3 | THD | — | -29 | — | dB |
| Output impedance | Z _O | — | 0,1 | 0,5 | kΩ |
| OSCI input | | | | | |
| Maximum allowable amplitude at OSCI | V _{OSC(p-p)} | — | — | V _{DD} -V _{SS} | V |
| Timing (V_{DD} = 3 V) | | | | | |
| Oscillator start-up time | t _{OSC(ON)} | — | 3 | — | ms |
| TONE start-up time; note 4 | t _{TONE(ON)} | — | 0,5 | — | ms |
| STROBE pulse width; note 5 | t _{STR} | 400 | — | — | ns |
| Data set-up time; note 5 | t _{DS} | 150 | — | — | ns |
| Data hold time; note 5 | t _{DH} | 100 | — | — | ns |

Notes to the characteristics

1. Crystal is connected between OSCI and OSCO; D₀/SCL and D₁/SDA via a resistance of 5,6 kΩ to V_{DD}; all other pins left open.
2. Related to the level of the LOW group frequency component (CEPT CS46-03).
3. Related to the level of the fundamental frequency.
4. Oscillator must be running.
5. Values are referenced to the 10% and 90% levels of the relevant pulse amplitudes, with a total voltage swing from V_{SS} to V_{DD}.

APPLICATION INFORMATION

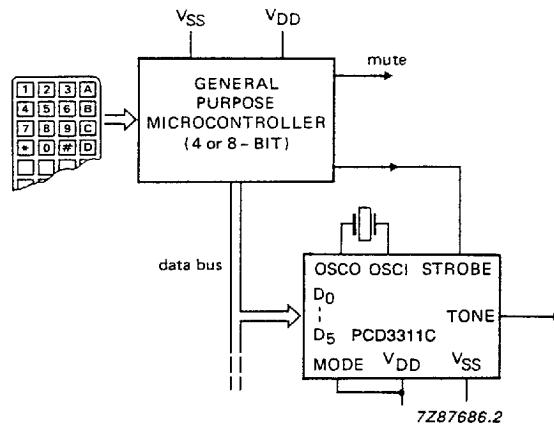

Fig. 23 PCD3311C driven by a microcontroller with parallel data bus.

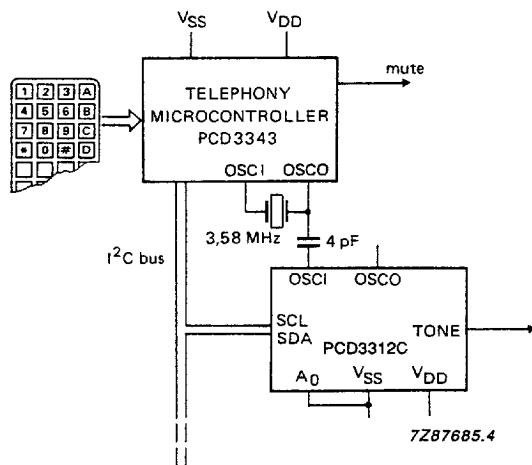

Fig. 24 PCD3312C driven by telephony microcontroller PCD3343 with serial I/O (I²C-bus).
The PCD3343 is a single-chip 8-bit microcontroller with 3K ROM/224 RAM bytes. The same application is possible with the PCD3311C with MODE = V_{SS}.
