CMOS PROGRAMMABLE LOW POWER SINGLE OPERATIONAL AMPLIFIER

- OFFSET NULL CAPABILITY (by external compensation)
- DYNAMIC CHARACTERISTICS ADJUSTABLE I_{SET}
- CONSUMPTION CURRENT AND DYNAMIC PARAMETERS ARE STABLE REGARDING THE VOLTAGE POWER SUPPLY VARIATIONS
- OUTPUT VOLTAGE CAN SWING TO GROUND
- VERY LARGE I_{SET} RANGE
- STABLE AND LOW OFFSET VOLTAGE
- THREE INPUT OFFSET VOLTAGE SELECTIONS

DESCRIPTION

The TS271 is a low cost, low power single operational amplifier designed to operate with single or dual supplies. This operational amplifier uses the ST silicon gate CMOS process giving it an excellent consumption-speed ratio. This amplifier is ideally suited for low consumption applications.

The power supply is externally programmable with a resistor connected between pins 8 and 4. It allows to choose the best consumption-speed ratio and supply current can be minimized according to the required speed. This device is specified for the following I_{SET} current values : 1.5 μ A, 25 μ A, 130 μ A.

This CMOS amplifier offers very high input impedance and extremely low input currents. The major advantage versus JFET devices is the very low input currents drift with temperature (see figure 3).
